Yes, there was one detection of cyanide west of the facility and one detection of cyanide north of the facility in domestic wells. Both detections were below the MCL for cyanide.

During subsequent sampling events, only the well west of the facility was resampled due to access. We did not detect cyanide in the two subsequent sampling events.

Rob

Mike,

Thanks for the clarification. Yes, my understanding is two hits.

Not exactly what he said. I'm paraphrasing but he said with only a single hit for cyanide, it may have been an anomaly and they would continue to sample the residential wells in Aluminum City. At least that's what I remember.

I think we actually had two hits?

Just wanted to highlight this sentence in the article I sent earlier.

Baris didn't have a direct answer to the question, but he noted as cleanups go, it was a fairly aggressive schedule. The main area of concern to date has been groundwater contamination of cyanide on wells located at the plant. No private residential wells have tested positive for the poison.
